FACULTY OF ENGINEERING

DEPARTMENT OF MINING AND WATER RESOURCES ENGINEERING

FINAL YEAR PROJECT

AN AUTOMOBILE CARBON EMISSION ANALYZER

Chen Chen Cornelius
BSc. Water Resources Engineering
corneliuschenchen60@gmail.com

A final year project submitted to the Department of Mining and Water Resources engineering as partial fulfillment of the requirements for the award of a Bachelor of Science degree in Water Resources Engineering

ABSTRACT

Fossil fuels are being continuously used in the transport sector. The burning of these fuels produces gases like carbon dioxide, methane, and nitrous oxides which lead to global warming. Most people are still unaware of the global warming contributed by automobiles thus, do not consider it to be a big problem in years to come especially in least developed countries. Many people have very little knowledge of automobile carbon emissions caused by them in Uganda. For example, almost 99% of the vehicles in the country use products of fossil fuels. Since Uganda doesn't manufacture or assemble vehicles, the country highly depends on reconditioned or used cars that are majorly imported from Asia. Currently, there is no measure of automobile emissions for the vehicles that are imported into the country. The current standing control measure, is a ban on importation of automobiles that are more than 8 years old. Notwithstanding, this control measure applies to a category of automobiles. This doesn't guarantee that automobiles imported in the country that are less than 8 years old, are less carbon emitters. With the ever-increasing road traffic in the cities and highways, automobile emissions are evident. Uganda being one of the least developed countries in the world, the country will still depend on used car imports in both short, medium and long terms. This implies that it might take quite a considerable time and efforts to phase out automobiles that use fossils. This severely affects the ecosystems and disturbs ecological balance. Because of this treacherous effect of global warming, some solutions must be devised for control and measure. The proposed carbon emission analyzer device can be used by customs, traffic officers and automobile insurers. It is estimated that transport sources in developing countries contribute about 4% of the global fossil carbon dioxide versus 18% by industrialized countries. The cost of urban air pollution is estimated to be 2% of GDP in developed countries and more than 5% in developing countries. With an annual vehicle registration growth of over 30% in 2008 and a population growth rate of 6%, the number of automobiles in Kampala city of Uganda is expected to continue growing exponentially. Most of the vehicles used are imported into the country when quite old with worn out engines and low energy efficiencies. As a result, such vehicles profusely emit exhaust gases which may be harmful to both human health and the environment. Controlling pollution from the transport sector is vital to improving the quality of air and protecting public health. The main types of exhaust gases from the automobiles were CO₂, NO_x, CO, NO and HC.

DECLARATION

I CHEN CHEN CORNELIUS, BU/UP/2017/1483 hereby declare that this report is the work of my hands and this research has never been presented by any person or institution for an academic award.

Signature: ... 

Date: 13th/03/2022

APPROVAL

This work has been compiled with guidance and consultation from my supervisors:

Mr. David Kimera

Signature 

Date 11th March 2022

Mr. Maseruka Bendicto Sajjabi

Signature.....

Date.....

ACKNOWLEDGEMENT

It is with great pleasure that I hereby express my appreciation to everyone who has contributed, in one way or another, to the completion of this Research work. Without your assistance, this work would have proved insurmountable.

I am grateful to my supervisors, Mr. Kimera David and Mr. Maseruka Benedicto Sajjabi for guiding me throughout the study. I thank the university through the HEPSSA project funded by the Royal Academy of Engineering.

This Research could not reach its present features. I am also thankful to Professor Kant Kanyarusoke. In addition, I would like to thank all my classmates Willis, Raymond, and Bridget you are stars and Lecturers in the program of Water Resources Engineering and Computer Engineering

Finally, I would like to give a grateful thank you to my parents. Last but not least, I am thankful to the almighty God for granting me good health, strength, and peace throughout the research period.

DEDICATION

This dissertation is dedicated to my Late Grandmother **Mrs. ATEO MAGRET** for her constant love and dedication to my education and her desire for the fulfillment of my life dreams and my crush.
