CO-SUPERVISOR: Mr. KAVUMA CHRIS

*A final year project report submitted in partial fulfillment of the requirements for the award of
a Bachelor of Science in Water Resources Engineering Busitema University*

ABSTRACT

The quality of surface water in many areas of the world is being deteriorated from both point and non-point sources however this study focuses on factors enhancing surface water pollution from non-point sources which is a necessity to enable implementation of management practices that control and prevent pollution. In this study, the basic factors enhancing pollution of surface water were identified including five factors—Land use/landcover, Flow accumulation, slope map, soil infiltration, and distance from streams and their thematic layers were prepared from some maps and satellite images by the remote sensing techniques, digitized and integrated in the GIS environment using Weighted Index Overlay Analysis (WIOA) method. The weights of different factors were objectively determined during the research. Through this integrated GIS analysis, potential risk pollution map of the study area was prepared. This work needs to be verified by further analysis of the potential risk polluting areas and also putting in consideration factors like soil depth and ground water depth and flow.

The output of the overlay in the pollution risk map were verified by looking at the Google Earth imagery and incorporation of USGS overlays (contours) in them and field visits in some cases were done. The study revealed that this approach can be used by decision makers as a land use planning tool.

DECLARATION

I GALIWANGO HILARY do here by declare that this project report is my original work and to the best of my knowledge, it has never been published and submitted for the award of any academic qualification in any University before.

APPROVAL

This is to certify that this project report by GALIWANGO HILARY of registration number BU/UG/2012/161 'DETERMINING POTENTIAL RISK AREAS OF POLLUTION IN A RIVER CATCHMENT USING GIS and REMOTE SENSING' has been carried out under my supervision and is now ready for submission to the academic board of Busitema University with my approval.

DEDICATION

This reserach is dedicated to my dear family; -(LATE) Mr. Kizito Godfrey(Requiescat in pace), Mrs Mubiru Ritah, Mr. Mubiru Patrick, Sanyu Hadija, Kiberu Jovan, Mukasa Tonny and Nakawooya Hildah for their support, heart calming and sensation words that encouraged me to move on in times of discouragement. May the almighty God bless the works of your hands!

ACKNOWLEDGEMENTS

First things first, I thank the ALMIGHTY GOD for enabling me among the many to be the channel through which his glory is manifested. Father thanks for being in me and guiding me through my studies and my entire life. WEBALE MUKAMA!

I would like to thank Mr. Kimera David and Mr. Kavuma Chris my supervisors for the great support and guidance they have offered to me and their dedication to always help me whenever I reached out to them. Furthermore, the entire department of Water Resources Engineering including Mr. Mugisha Moses, Mr. Lwanyaga Joseph, Mr. Oketcho Yoronimo, Mrs. Engole Marion and all the lectures in the department thank you a lot for the mentorship I am very grateful.

I acknowledge Dr. Lokay Christian, Rev. Fr. John K. Lubega, Mr. Evers Werner, Mr. Thomas Fendesack, Mr. Stéphan Evers, and my Gastfamilie in Germany the Kroger family;-Heinz, Margret, Kerstin and Andre, thanks a lot for your support I am what I am today because you have been there for me whenever I need you.

It is my pleasure to thank the following key experts in the area of my project research:-, Prof. Isabirye Moses (Faculty Dean Busitema Namasagali Campus, GIS specialist), Francisco Sambalino (Agronomist, Spate Irrigation network) and Taye Alemayehu (hydrogeologist PhD student, Ethiopian Institute of Water Resources in Addis Ababa University. They have provided me with all required information required as per the completion of my research.

My heartfelt thanks also go to my dear friends Maseruka S Benidcto, Wananda Sam, Kyaluzi Julian, Apacho Ritah Chloe, Ajok Paska, Omoding Genason, Trust Brenda, the entire fourth year class of BSc. Water Resources Engineering students 2016 for their academic, social and moral support also not forgetting Busitema University Water Resources Students Association for the professional development and leadership experience.

1 CHAPTER ONE

1.1 INTRODUCTION

This chapter includes the following: back ground to the study, statement of the problem, objectives of the study, justification, scope of the study, limitations, and the project area.

1.2 BACK GROUND

Water covers a big portion of the earth is the source of life but only 3% of the world's water is fit for human consumption due to its being fresh (USGS, 2016). As it flows through rivers and streams of the earth, water supports life just like blood flowing in the blood vessels of a person. Unfortunately over time this finite resource which is very essential for life is being polluted as it flows in the cycle.

The escalating levels of pollution in water bodies most especially in rivers shows that there is inefficiency in controlling non-point polluting sources and this is mainly because of the difficulty found in identifying the most polluting points in the catchment. In turn many problems are caused to the ecosystem and high costs of raw water treatment. This calls for control measures to aid the decision makers and stakeholders to avert the problem at hand. Protecting the water resources requires an in-depth knowledge of the dynamic behavior of the watershed. Because of increased pressure on these vital resources it has become essential for resources planners to adopt ways and means for analyzing problems associated with space and time (Jasrotia & Singh 2006).

In most Ugandan rivers, the water quality has greatly been deteriorated in the past decades, and this is as a result of increasing anthropogenic activities such as industrialization, mining activities, and agricultural activities mainly those dependent on use of artificial fertilizers and poor municipal wastewater and wastes management.

The activities carried out in the river's catchment will have a great impact on the quality of the water in a given river, also depending on the catchment/basin characteristics like land use/land cover, elevation and slope, rainfall intensity, soil type, among others.
