COSUPERVISOR: MS. HOPE NJUKI

A final year project proposal submitted to the Department of Mining and Water Resources Engineering as a partial fulfillment of the requirements for the award of a Bachelor of Science degree in Water Resources Engineering.

ACKNOWLEDGEMENT

I thank the Almighty God for the far that He has brought me, the gift of life, knowledge, hope protection and his provision to me during and throughout the writing of this project proposal.

I extend my deep sense of gratitude and indebtedness to my academic supervisors, Ms. Hope Njuki as well as Mr. Maseruka Benedicto for their kind attitude, keen interest, immense help, inspiration and encouragement which helped me throughout this project proposal. Thank you for to the entire staff of the department of Mining and Water Resources Engineering Busitema University for providing all kind of possible assistance throughout this project proposal writing.

Special thanks go to my family; Maj. Jimmy Henry Lutalo, my mother Mrs. Beatrice Lutalo, my brothers and sister for their unconditional love, care and guidance.

Thanks my dear friends in directing me, their tremendous tireless support and guidance given to me during the writing of this proposal.

Lastly, I thank all those who were involved directly or indirectly during my project proposal writing.

May the good Lord reward you all!

DECLARATION

I, **LUTALO WYCLIFF HENRY**, here by certify and confirm that the information I have written in this project proposal is a result of my own effort, research and has not been submitted before to any university or institution of higher learning for any academic award.

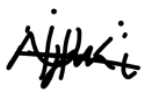

LUTALO WYCLIFF HENRY

APPROVAL

This proposal on the development of a machine learning algorithm to predict soil moisture has been written under the supervision of;

Name: **Ms. Hope Njuki**

Signature: 

Date: 03/06/2023

Abstract

This study investigated soil moisture content with real data measured from cropped farm areas especially irrigation schemes. Soil moisture content is important in irrigation scheduling (when to irrigate and how much to irrigate), which is key in the growth and development of the agricultural sector. In order to aid farmers, get real time soil moisture predictions, we have designed a locally hosted web application using a maize farmland dataset obtained from Kaggle.com. the application can be used to predict soil moisture to a tune of 80% accuracy. This application can be used round the clock. In building the model, 5 machine learning techniques were used and these were Random Forest Algorithm, Gradient Boosting regressor, the lasso regressor, elastic net regressor and the ridge regressor. With this application, farmers can obtain soil moisture readings without the need for soil moisture probes.

LIST OF ACRONYMS

ML – Machine Learning

AI – Artificial Intelligence

RFA – Random Forest Algorithm

NDP III – National Development Plan 3

Contents

LIST OF FIGURES	ix
CHAPTER 1: INTRODUCTION	1
1.1 Background of study	1
1.1.1 Irrigation Agriculture	2
1.1.2 Machine Learning	3
1.2 Problem Statement	3
1.2 Research Objectives	3
1.2.1 Main Objective	3
1.2.2 Specific Objectives	3
1.3 Research Questions	4
1.4 Justification	4
1.5 Scope of the Study	4
Chapter 2: Literature Review	5
2.1 Specific Objective 1	5
2.1.1 Soil Moisture	5
Factors affecting soil moisture	5
2.1.2 Machine Learning	6
Supervised Learning	7
2.1.2.1 existing Soil moisture prediction applications.	8
2.1.3 Model Scoring	8
2.1.4 Methods of prediction	10
Performing the Regression	13
2.1.5 Calibration and Validation	14
Chapter 3: Methodology	15
3.1 Objective 1: Data collection	16
3.2 Objective 2: Build a pipeline structure that automates the processing and harmonizing of the input, trains the model, and creates a SM prediction.	18
3.3 Objective 3: Calibrate and Validate the Model	19
3.3.1 Prediction model selection	19
3.3.2 Calibration and Validation	20
3.4 Objective 4: Integration into a web application	21
CHAPTER 4: Results and discussion	23
CHAPTER 5: Conclusions and Recommendations	25

Equation 7: PCA approach.....	16

CHAPTER 1: INTRODUCTION

1.1 Background of study

Agriculture across many regions in the global south, such as Africa, Latin America, and South Asia, depend mainly on rainfed agriculture for their staple food production. In Africa over 95% of agriculture is rainfed, contributing to 65% of the employment and 35% of the gross domestic product on the continent. Agriculture employs over 70% of Uganda's population and contributes most to Uganda's gross domestic product (GDP) which increased by 3.4 % in 2020-2021 from 17.8 in 2019-20. In 2020, the contribution of agriculture reached as high as 9715 UGX billion(Bwambale & Mourad, 2022). With a 3% annual growth rate, the demand for agricultural products for household consumption is increasing and hence more people are getting involved in agriculture due to the readily available market.

Irrigated agriculture contributes about 40 percent of the global food production from an estimated 20% of agricultural land, or about 300 million hectares globally (McGuire, 2015). Irrigated farmland typically generates three times the production of an equivalent area farmed under dry-land systems.

The Government in its Vision 2040 and in the NDP III (2016-2020) appropriately lists irrigation investment as a high priority along with agricultural value-chain development. The National Agricultural Policy (NAP, Ministry of Agriculture, Animal Industry and Fisheries, MAAIF, 2010), which stipulates the sectoral approach to the NDP, emphasizes the need for rehabilitating public irrigation schemes, transferring the management responsibility of irrigation schemes to the lowest appropriate levels and establishing new irrigation schemes.

Soil moisture Is an important factor in effective irrigation in that determining soil moisture content provides for a means to determine how much water to irrigate and when to irrigate. Knowing the soil moisture content of a soil at 2 different dates enables for calculation of the crop water consumption between those dates, when such measurements are continued for a year or more, it is possible to calculate annual crop water requirement. The amount of water a soil is able to hold from an irrigation can also be determined from the same measurements. Soil moisture measurements can as well be used to detect problems that may exist due to water in the root zone(Marsh, n.d.)

Traditionally, field-based measurements of SM have been limited to in situ recordings using SM probes. This implies that for large irrigation fields, to have SM measurements from various fields of
