ABSTRACT

Maize grain storage occupies a vital role in Uganda's economy. Proper monitoring of maize grain storage is essential to reduce losses. The present system involves human effort in most of the activities which reduces work efficiency and increases time consumption. These difficulties can be avoided by this project. In this project, the controlling and monitoring of the maize grain storage area is fully automated. The main objective of the project was to design an optimum air conditioning system for maize grain storage and processing to control and maintain the temperature in storage area at a desirable value which prevents the formation of microorganisms and spoilage of grains. In this project temperature is the main parameter that is essential for proper storage of maize grains and is taken as an input parameter to be controlled automatically using the programmable logical controller and is measured using a temperature sensor.

The system was modeled using Matlab Simulink tool box and accomplished using proteus software for simulation and Embedded C Programming language for coding. The design consist of a microcontroller to receive input signals from the temperature sensor and processes the data acquired and then sends the output signal to the LCD to be displayed on the screen. The simulation results of the designed system indicated that temperature of the maize grain storage room must be kept constant by monitoring and controlling it automatically to prolong the storage period to more than one year and the simulation validated the expected behavior of system hardware if implemented.

The system is best suited for commercial maize grain dealers and processors to maintain high quality grains for longer periods.

DECLARATION

I UTHUMAN MABIRIZI hereby declare to the best of my knowledge that the work presented in this proposal is my original work and has not been presented in any institution of higher learning/University for similar awards.

ACKNOWLEDGEMENT

Success in life is never attained single handedly. I would like to express my heartfelt gratitude to the Almighty God for everything He has done in my life and my education career.

I would like to extend my sincere gratitude to my dear parents, my father Sheikh Zubair Kayongo (now the late) and my mother Hajjat Rehemah Nabatanzi Kayongo for their unlimited support towards pursuing my career.

I would also like to take this opportunity to thank my project supervisors Mr. Joseph D. Lwanyaga (main supervisor) and Mr. Edward L. Ssemukasa for their precious time, patience, guidance, motivation, and utmost support towards completion of this proposed project on time amidst their fixed schedules.

I would also like to thank my technical adviser Mr. David Kimera for his unlimited efforts towards successful completion of this proposed project

My sincere appreciation goes to Busitema University Department of Agro-Processing Engineering, more especially the Head of Department, all my lecturers for their moral and technical support.

I also extend my appreciation to my friends in Busitema University most especially Kavuma Ashiraf, Kakumba Ezra, Kazibwe James, Nsubuga Pius, Kimera Gideon, Kinene Jimmy, Lubega Peter, Matovu Fredrick and all my classmates for having made my academic and social life comfortable in Busitema University.

I would like to appreciate my family relatives and friends for everything they have done towards pursuing my career.

MAY THE ALMIGHTY GOD REWARD YOU ABUNDANTLY

CHAPTER ONE: INTRODUCTION

1.0. Background

Maize (*Zea mays L*), is the third most important cereal grain worldwide after wheat and rice (Golob, *et al.*, 2004), maize is referred to as the cereal of the future for its nutritional value and utilization of its products and by-products (Lee, 1999). The demand for maize has been estimated to increase by 50% to 837 million metric tons in 2020 (Martinez *et al.*, 2011). According to Food and Agricultural Organization (FAO), 2006 report on maize, the demand for maize is fuelled by its diverse uses, from food processing, animal feed, to ethanol production. Maize is a basic staple food grain for large parts of the world including Africa, Latin America, and Asia (Yaouba *et al.*, 2012). In tropical and subtropical countries like Uganda, a large proportion of the grain (such as maize) is harvested and stored under hot and humid conditions, and most farmers lack proper knowledge, equipment and methods of drying and storing grains (Weinberg *et al.*, 2008). Subsequently, the grains are stored while still relatively moist and warm resulting into rapid deterioration of the grains and promote the growth of microorganisms (for example fungi and bacteria) and insects (Ekechukwua and Norton, 1999).

The world has reached a level where everything can be controlled and operated automatically, but there are still few important sectors in Uganda where automation has not been adopted or not been put to a full- fledged use perhaps because of several reasons such as cost. Agriculture has been one of the primary occupations of man since early civilizations and even today manual interventions in farming and storing grains are inevitable. In Uganda maize is produced on a seasonal basis, and in many places there is only one harvest a year, which itself may be subject to failure. This means that in order to feed the world's population, most of the global production of maize, wheat, rice and millet must be held in storage for periods varying from one month up to more than a year. Maize grain storage therefore occupies a vital place in Uganda's economy. To maintain high quality during storage, maize grains should be protected from weather (including relative humidity and temperature), growth of microorganisms and insects (Oyekale *et al.*, 2012).

Temperature and moisture content of the cereal grains are the two key features affecting the resulting quality of the grain, biochemical reactions, dry matter losses, allowable storage times and overall storage management of the grain (Lawrence and Maier, 2010). The current
